

Keep your home safe and germ free with Sanondaf

It is important that your home is safe and as germ free as possible, for the health of your family and everyone who visits your home. After all, when a flu bug or worse affects a family member, it is usually only a matter of time before it spreads throughout the household. Unfortunately, it is then all too easy for the cause of the problem to be passed onto anyone they come into contact with.

Over 50,000 cases of MRSA, E-coli and C-diff infections annually, highlight just how vulnerable we all are to the risk of cross contamination and infection.

It's not just bacteria and viruses to look out for when it comes to keeping your home healthy. Allergens caused by your pets, mould or fungi are capable of causing adverse allergic reactions – especially if there's a history of asthma or allergies in your family.

Let Sanondaf help you eradicate the invisible threat in your home, and reduce your risk of exposure to infection causing bacteria and viruses..

How does the Sanondaf process work?

Sanondaf uses a unique and innovative technology to provide a completely touch-less disinfection solution for your home. Our machines distribute a dry disinfectant fog into the atmosphere, into every area of your home or outbuildings, meaning the process can reach areas that traditional methods simply don't reach.

This will rid your home of the germs, mould, bacteria & fungi lurking in the dark and difficult to reach corners, as well as the high usage areas of your home, which are often unseen sources of contamination. By killing 99.99% of the harmful germs and bacteria, Sanondaf provides the peace of mind that your home is a safer place for your family.

Our patented chemical, applied using our unique fogging and spraying technology is completely non-corrosive. This means our process can be used on all electrical and electronic devices and all soft & hard furnishings safely without causing damage or leaving any unsightly residue on any surface treated.

Sanondaf Kills 99.99% of:

- ✓ Norovirus
- ✓ Salmonella
- ✓ Hepatitis & HIV
- ✓ H1N1 & H5N1 (Flu Viruses)
- ✓ Clostridium Difficile (C-diff)
- ✓ Escheria coli (E-coli)
- ✓ MRSA
- ✓ Poliovirus 1
- ✓ Tuberculosis Mycobacterium
- ✓ Legionella Pneumophila
